MILE Encoder for EC 60 flat – Product Information

Figure 1 EC 60 flat with MILE-Encoder (633399, 645106)

The MILE encoder uses an inductive angle measurement system to generate incremental quadrature output signals. Two channels (A, B) with differential electrical signals are available. Four resolutions are factory-programmable: 512, 1024, 2048, and 4096 impulses per turn.

The encoder is designed for highest robustness in industrial applications. It can be operated in the open environment of an EC flat motor and is equipped with additional ESD protection circuitry. Due to the robustness of the MILE technology in terms of magnetic interference it was possible to integrate the encoder into the flat motor with minimal change of dimensions with respect to a motor without encoder.

Pin-out is compatible to most maxon motor controllers with encoder interface.

2 Protection and Robustness

- Outputs for Hall sensor and encoder (line driver) are protected by ESD protection diodes designed for an ESD level of at least 2 kV according to EN 61000-4-2.
- In addition, outputs for Hall sensor and encoder (line driver) are protected by series resistances of 47 Ohm or 56 Ohm, respectively.
- The encoder by virtue of its inductive operating principle is immune to magnetic interference, dust, and dirt.

3 Definitions

Metric	Definition	Illustration
Angle Error [°m]	Difference of measured and true angular shaft position at each position.	360° ↑ Measured angle φ' [°m]
Average Angle Error [°m]	Average of Angle Error over a number of turns.	Ideal: φ' = φ
Integral Nonlinearity (INL) [°m]	Peak-to-peak value of Average Angle Error.	True: φ' ≠ φ 360° True angle φ [°m]
Jitter (Repeatability) [°m] or [LSB]	Six standard deviations of Angle Error per turn (over one turn, at a given number of turns). Jitter [°m] is typically independent of resolution and defines the maximum useful positioning repeatability. Jitter [LSB] is resolution-dependent. At given Jitter [°m], the value is roughly proportional to resolution.	Angle error ε [°m] True angle φ [°m] Mean value (100 turns) O.5°
		irue angie φ [mj
Least Significant Bit (LSB)	Minimum measurable difference between two angle values at given resolution (= quadcount, = State).	Measured discrete angle φ' [°m] 360° State error δ [LSB]
State Error [LSB]	Difference between actual state length and average state length.	V Nominal state: 1 LSB (qc)
Average State Error [LSB]	Average of State Error over a number of turns for each state of a turn.	360° ↑ True angle φ [°m]
Differential Nonlinearity [DNL]	Maximum positive or negative Average State Error.	0.5 State error δ [LSB] DNL [LSB] 360°
		-0.5 True angle ϕ [°m] Mean value (100 turns)
		Non repeatable (100 turns) 0.1 -0.1 True angle φ [*m]
Minimum State Length [°el]	Minimum measured state length within a number of turns relative to pulse length.	. 1
Maximum State Length [°el]	Maximum measured state length within a number of turns relative to pulse length.	Time
Minimum State Duration [ns]	By chip limited minimum time separation between two A/B transitions.	Time
		Noninal State Time Makinum State

4 Pin Assignment

Maximum permitted Supply Voltage

- · Make sure that supply power is within stated range.
- Supply voltages exceeding the stated range, or wrong polarity will destroy the unit.
- Connect the unit only when supply voltage is switched off (V_{cc}=0).
